WHAT IS CLAIMED IS:

1	1.	A method for improving performance by increasing available bandwidth in a network
2	system	that includes one or more requestor nodes, one or more provider nodes and one or
3	more in	ntermediate nodes, the method comprising:

- determining a digital signature of a requested file stored by at least one provider node in the network system;
- looking up the digital signature in an index of signatures; and
- forwarding a previously compressed version of the requested file that has been stored at an intermediate node when the digital signature is found in the index of signatures.
 - 2. The method of claim 1 further comprising compressing the requested file and storing the digital signature in the index of signatures when the digital signature is not found in the index of signatures.
 - 3. The method of claim 2 further comprising sending the compressed version of the requested file to a requestor node.
 - 4. The method in claim 2 further comprising sending the compressed version of the requested file to a requestor node and storing the compressed version of the requested file at the intermediate node.
- 5. The method of claim 1 wherein determining the digital signature comprises applying a hashing technique to the requested file.
- 1 6. The method of claim 5 wherein applying the hashing technique comprises applying a version of the MD5 algorithm to the requested file.
- 7. The method of claim 5 wherein applying the hashing technique comprises applying a version of the SHA algorithm to the requested file.
- 1 8. The method of claim 1 further comprising determining whether an estimated time 2 required to directly provide the requested file to a requestor node is less than an estimated

- time to determine if a previously compressed version of the requested file is already stored at
- 4 the intermediate node.
- 1 9. The method of claim 2 wherein determining the digital signature includes
- determining the digital signature at the provider node.
- 1 10. The method of claim 9 wherein looking up the digital signature includes looking up
- the digital signature at the provider node.
- 1 11. The method of claim 9 wherein looking up the digital signature includes looking up
- the digital signature at the intermediate node.
- 1 12. The method of claim 1 wherein determining the digital signature includes
- determining the digital at the intermediate node.
- 1 13. The method of claim 12 wherein looking up the digital signature includes looking up
- the digital signature at the provider node.
- 1 14. The method of claim 12 wherein looking up the digital signature includes looking up
- the digital signature at the intermediate node.
- 1 15. The method of claim 12 wherein the intermediate node comprises a caching server.
- 1 16. The method of claim 1 wherein looking up the digital signature includes looking up
- the digital signature at the provider node.
- 1 17. The method of claim 1 wherein looking up the digital signature is performed at the
- 2 intermediate node.
- 1 18. The method of claim 1 further comprising receiving the index of digital signatures
- 2 from a provider node.

5

- 1 19. The method of claim 1 further comprising receiving the index of digital signatures
- 2 from an intermediate node.
- 1 20. The method of claim 1 wherein determining the digital signature is performed at the
- 2 provider node.
- 1 21. The method of claim 1 wherein determining the digital signature is performed at the
- 2 intermediate node.
- 1 22. An apparatus for improving the performance of a network system by increasing
- 2 available bandwidth, the apparatus being configured to:
- determine a digital signature of a requested file stored by at least one provider node in
- 4 the network system;
 - look up the digital signature in an index of signatures; and
- forward a previously compressed version of the requested file that has been stored at
- an intermediate node when the digital signature is found in the index of signatures.
- 1 23. The apparatus of claim 22 wherein the apparatus is further configured to compress the
- 2 requested file and store the digital signature in the index of signatures when the digital
- 3 signature is not found in the index of signatures.
- 1 24. The apparatus of claim 23 further comprising an output interface for sending the
- 2 previously compressed version of the requested file to a requestor node.
- 1 25. The apparatus of claim 22 wherein the apparatus comprises a provider node.
- 1 26. The apparatus of claim 22 wherein the apparatus comprises an intermediate node.
- 1 27. The apparatus of claim 26 wherein the apparatus comprises a proxy server.
- 1 28. The apparatus of claim 26 wherein the apparatus comprises an IP tunnel.

- 1 29. The apparatus of claim 26 wherein the apparatus comprises a caching server.
- 1 30. A computer program for increasing available storage in a network system, the
- 2 computer program being stored on a computer readable medium and comprising instructions
- 3 for:
- determining a digital signature of a requested file stored by at least one provider node
- 5 in the network system;
- looking up the digital signature in an index of signatures; and
- forwarding a previously compressed version of the requested file that has been stored
- at an intermediate node when the digital signature is found in the index of signatures.
- 1 31. The computer program of claim 30 further comprising instructions for compressing
- the requested file and storing the digital signature in the index of signatures when the digital
- 3 signature is not found in the index of signatures.
- 1 32. The computer program of claim 31 further comprising instructions for sending the
- 2 compressed requested version of the file to a requestor node.
- 1 33. The computer program of claim 31 wherein, the computer readable medium
- 2 comprises a requestor node.
- 1 34. The computer program of claim 31 wherein the computer readable medium comprises
- 2 a provider node.
- 1 35. The computer program of claim 31 wherein the computer readable medium comprises
- 2 an intermediate node.
- 1 36. The computer program of claim 30 wherein the computer readable medium comprises
- 2 a disc.
- 1 37. The computer program of claim 30 wherein the computer readable medium comprises
- 2 a propagated signal.
